

Last Z App Summary

A Next.js command center for the BOM alliance that tracks player performance, ingests combat screenshots, and manages recruitment, alliance-duel operations, access control, and bug reporting. The repo positions it as an alliance dashboard backed by Prisma and PostgreSQL.

Who it's for Alliance leaders, officers, and members managing BOM roster performance and operations.	Repo evidence Next.js 16 app router, Prisma models for players/snapshots/auth/recruitment/duel/bugs, and role-gated UI views.
--	---

What It Does

- Performance dashboard with leaderboard, roster analytics, and player radar comparisons.
- Profile view for combat stats, recent snapshots, leader notes, and daily duel compliance.
- OCR-assisted profile upload with local Tesseract parsing and Gemini name extraction fallback.
- Alliance Duel tracking with daily requirements, screenshot parsing, review queues, and manual score updates.
- Recruitment workspace for applicants and migration candidates, including scoring weights and CSV import/export support.
- Admin and access-control tools for roles, permissions, account creation, sessions, and password resets.
- Bug logging and review screens for alliance issue tracking.

How It Works

- **UI layer:** Next.js app-router page composes dynamic React panels for profile, overview, recruitment, duel, roster, bugs, and admin views.
- **Server logic:** Server actions in `src/app/actions` validate permissions, sanitize inputs, and write roster, duel, recruitment, auth, and bug data.
- **Data access:** Utilities use Prisma Client plus Next cache/tag invalidation for players, snapshots, admin data, recruitment, and duel queries.
- **Ingestion flow:** Screenshot upload runs client-side OCR/parsing; parsed or reviewed results are sent through server actions and stored as player snapshots or duel scores.
- **Storage/services:** PostgreSQL is required via `DATABASE_URL`. Optional vision helpers use `GEMINI_API_KEY` and `HUGGINGFACE_API_KEY` when configured.

How to Run

- 1 Install dependencies: `npm install`.
- 2 Set env vars: `DATABASE_URL`; optional `GEMINI_API_KEY` and `HUGGINGFACE_API_KEY`.
- 3 Initialize Prisma for first setup: `npx prisma generate` and `npx prisma db push`.
- 4 Start dev server: `npm run dev`, then open `http://localhost:3000`.

Not found in repo: production monitoring/observability stack, background jobs, queue system, and formal API documentation.
